

Kreutles

Facts:

Town: **Unterloiben**
Alternative notation: **Kräutles**
Insolation in hours per year: **2379**
Size in ha: **8,82**

Terraced vineyard: **No**
Slope gradient: **Ø 6 %**
Altitude: **212 - 231 m**

Description

The Kreutles vineyard is the more eastern of the two slope toe locations on the Loibenberg. The name can be followed back to documents from the year 1353, referring to the former undergrowth that had to be removed to cultivate the area.

Soil profile Kreutles

The Kreutles vineyard at the foot of the Loibenberg is formed from loess. Loess is a fertile and calcareous glacial sediment that is transported by wind.

Two distinct horizons can be seen in the profile: the upper horizon that is enriched with humus, and the brownish-red loess horizon. This soil has developed from eroded Gföhl gneiss material from the nearby Loibenberg. At the top left of the humus horizon, there is a pebble from a transported glacial Danube riverine terrace, which was also transported down to the Kreutles vineyard by slope erosion on the Loibenberg.

The wines from loess soils are expressive, and depending on the winemaker's signature, they can also reach baroque richness.
